Authentication with Terraform

Before diving into managing environments or creating a resources with Terraform, the crucial initial step involves Authentication and Authorization

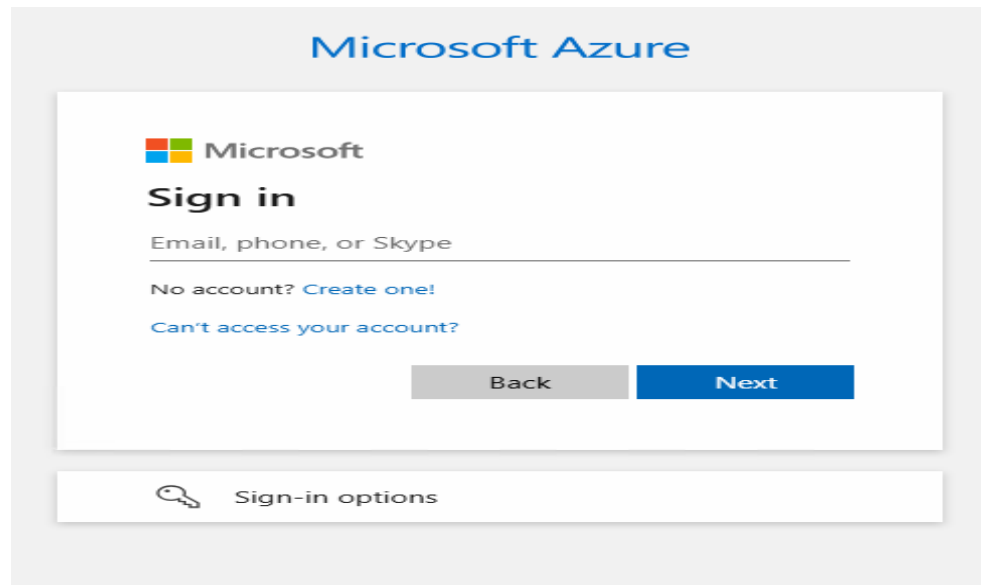

Authentication with Terraform

First Step : open a CMD & Type AZ login

```
PS C:\Users\sanu> az login
A web browser has been opened at https://login.microsoftonline.com/organizations/oauth2/v2.0/authorize. Please continue the login in the web browser. If no web browser is available or if the web browser fails to open, use device code flow with 'az login --use-device-code'.
```

Second Step: A web browser will be opened to enter the username & password for the authentication.

Authentication with Terraform

Third Step :Once you authenticate yourself, the below message will come.

```
C:\Users\sanu>az login
Select the account you want to log in with. For more information on login with Azure CLI, see https://go.microsoft.com/fwlink/?linkid=2271136

Retrieving tenants and subscriptions for the selection...

[Tenant and subscription selection]

No      Subscription name  Subscription ID          Tenant
-----
[1] *   Pay-As-You-Go    a40088c8-9fd4-4470-9ebf-310f174f723e  Default Directory

The default is marked with an *; the default tenant is 'Default Directory' and subscription is 'Pay-As-You-Go' (a40088c8-9fd4-4470-9ebf-310f174f723e).

Select a subscription and tenant (Type a number or Enter for no changes):

Tenant: Default Directory
Subscription: Pay-As-You-Go (a40088c8-9fd4-4470-9ebf-310f174f723e)

[Announcements]
With the new Azure CLI login experience, you can select the subscription you want to use more easily. Learn more about it and its configuration at https://go.microsoft.com/fwlink/?linkid=2271236

If you encounter any problem, please open an issue at https://aka.ms/azclibug

[Warning] The login output has been updated. Please be aware that it no longer displays the full list of available subscriptions by default.

C:\Users\sanu>
```

Visual Studio Code Extensions

Azure CLI

- Extensions in Visual Studio enable you to customize and enhance your experience by adding new features or integrating existing tools.
- They provide a diverse array of functionalities including color management, auto-complete enhancements, and spell-checking capabilities
- HashiCorp also provides extension for Terraform for Visual Studio Code.

Providers in Terraform

- Terraform supports multiple vendors, and each vendor is represented by its own provider.
- Depending on what type of infrastructure we want to launch, we have to use appropriate providers . Eg: Azure task use Azure providers , Aws task use Aws providers.

How does Terraform provider works ?

Terraform creates and manages resources on cloud platforms and other services through their application programming interfaces (APIs). Providers enable Terraform to work with virtually any platform or service with an accessible API.

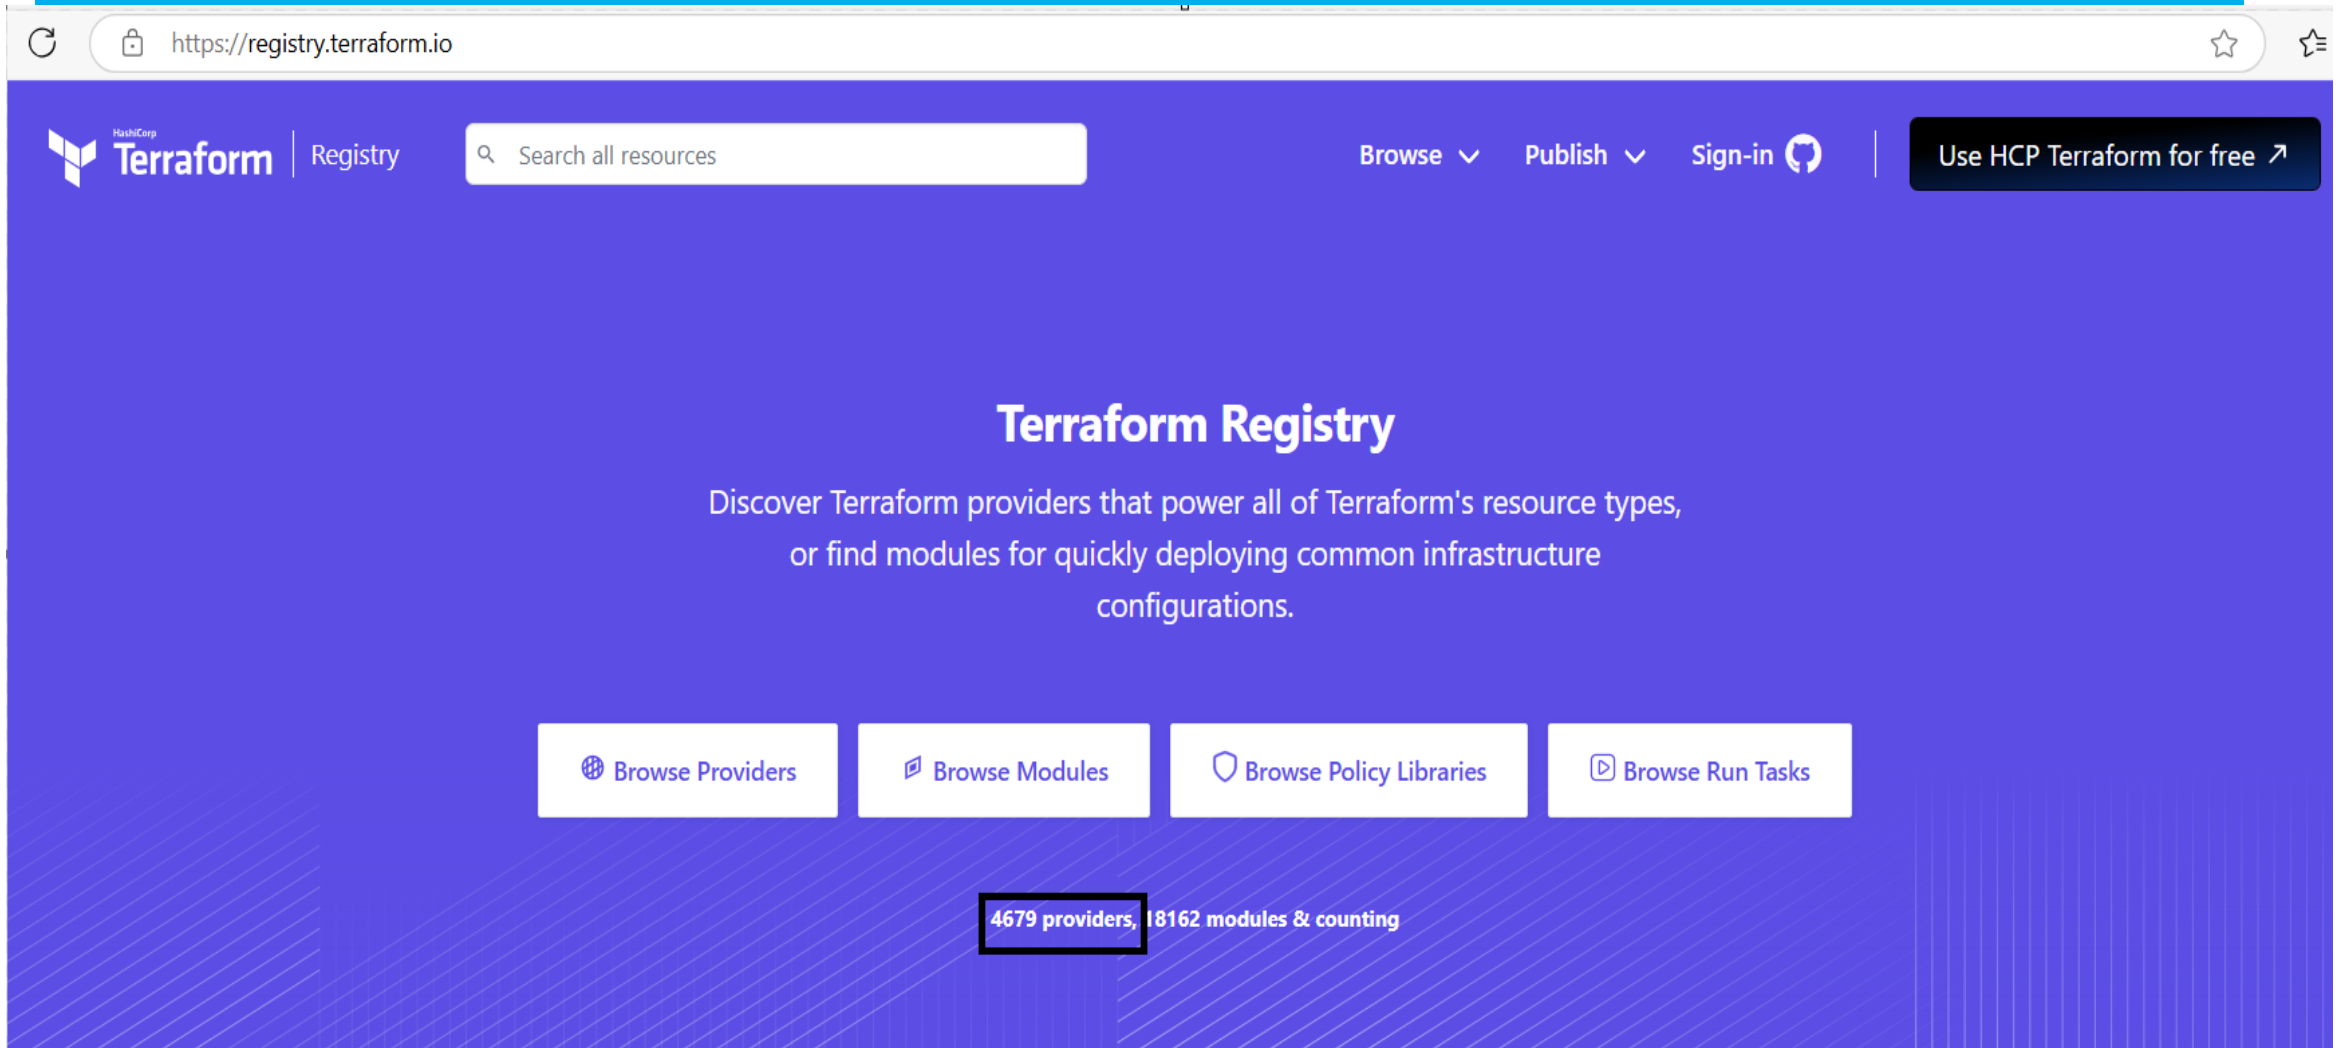

Important Question

Today, I am working in Azure and learning Terraform through Azure. If in the future I start working in AWS, will I need to learn Terraform again

The core concepts and standard syntax remain similar across all providers. If you learn Terraform on one provider, you will be able to work with all providers easily

registry.terraform.io

The screenshot shows the Terraform Registry website. The browser's address bar displays 'https://registry.terraform.io'. The page has a purple header with the Terraform logo, a search bar, and navigation links for 'Browse', 'Publish', and 'Sign-in'. A dark button in the top right corner says 'Use HCP Terraform for free'. The main content area has a purple background with the title 'Terraform Registry' and a description: 'Discover Terraform providers that power all of Terraform's resource types, or find modules for quickly deploying common infrastructure configurations.' Below this are four white buttons: 'Browse Providers', 'Browse Modules', 'Browse Policy Libraries', and 'Browse Run Tasks'. At the bottom, a black box highlights the text '4679 providers, 18162 modules & counting'.

How to use this provider

To install this provider, copy and paste this code into your Terraform configuration. Then, run `terraform init`.

Terraform 0.13+

```
terraform {
  required_providers {
    azurerm = {
      source = "hashicorp/azurerm"
      version = "3.108.0"
    }
  }
}

provider "azurerm" {
  # Configuration options
}
```

azurerm_resource_group

Manages a Resource Group.

Note:

Azure automatically deletes any Resources nested within the Resource Group when a Resource Group is deleted.

Note

Version 2.72 and later of the Azure Provider include a Feature Toggle which can error if there are any Resources left within the Resource Group at deletion time. This Feature Toggle is disabled in 2.x but enabled by default from 3.0 onwards, and is intended to avoid the unintentional destruction of resources managed outside of Terraform (for example, provisioned by an ARM Template). See [the Features block documentation](#) for more information on Feature Toggles within

Terraform Commands

Terraform Commands

Overview of Terraform Init Initialization

Phase

- Initializes a new or existing Terraform configuration.
- Downloads necessary providers and modules specified in the configuration.
- Creates a .terraform directory to store configuration and provider information locally

```
C:\Users\gaura\Desktop\Terraform_Demos>terraform init
```

```
Initializing the backend...
```

```
Initializing provider plugins...
```

```
- Finding latest version of hashicorp/azurerm...  
- Installing hashicorp/azurerm v2.65.0...  
- Installed hashicorp/azurerm v2.65.0 (signed by HashiCorp)
```

```
Terraform has created a lock file .terraform.lock.hcl to record the provider  
selections it made above. Include this file in your version control repository  
so that Terraform can guarantee to make the same selections by default when  
you run "terraform init" in the future.
```

```
Terraform has been successfully initialized!
```

```
You may now begin working with Terraform. Try running "terraform plan" to see  
any changes that are required for your infrastructure. All Terraform commands  
should now work.
```

```
If you ever set or change modules or backend configuration for Terraform,  
rerun this command to reinitialize your working directory. If you forget, other  
commands will detect it and remind you to do so if necessary.
```

Overview of Terraform fmt

```
resource "azurerm_resource_group" "rg" {  
  name = rg1  
  location = "Central US"  
}
```

**After
fmt**

```
resource "azurerm_resource_group" "rg" {  
  name      = rg1  
  location = "Central US"  
}
```

Before fmt

- The terraform fmt command is used to rewrite Terraform configuration files to take care of the overall formatting.

Overview of Terraform Validate

Terraform validate mainly checks if the configuration syntax is correct

It can check various aspects including unsupported arguments, undeclared variables and others.

```
resource "azurerm_resource_group" "rg" {  
  name      = "rg1"  
  locations = "Central US"  
}
```

```
The argument "location" is required, but no definition was found.  
  
Error: Unsupported argument  
  
on first_vm.tf line 7, in resource "azurerm_resource_group" "rg":  
7:   locations = "Central US"  
  
An argument named "locations" is not expected here. Did you mean "location"?
```

Terraform Plan

The `terraform plan` command creates an execution plan. By default, creating a plan consists of:

- Analyzes and evaluates the Terraform configuration.
- Displays a preview of changes to be applied.
- Identifies new resources, modifications, and deletions.

```
C:\Users\gaura\Desktop\Terraform_Demos>terraform plan

Terraform used the selected providers to generate the following execution plan. Resource actions are
indicated with the following symbols:
  + create

Terraform will perform the following actions:

  # azurerm_resource_group.example will be created
  + resource "azurerm_resource_group" "example" {
    + id           = (known after apply)
    + location     = "westus"
    + name         = "testgroup1"
  }

Plan: 1 to add, 0 to change, 0 to destroy.
```

Terraform Apply

- Executes the planned changes after confirmation.
- Applies modifications to the infrastructure.
- Creates, updates, or deletes resources as per the configuration.

```
C:\Users\gaura\Desktop\Terraform_Demos>terraform apply

Terraform used the selected providers to generate the following execution plan. Resource actions are
indicated with the following symbols:
  + create

Terraform will perform the following actions:

  # azurerm_resource_group.example will be created
  + resource "azurerm_resource_group" "example" {
    + id          = (known after apply)
    + location    = "westus"
    + name        = "testgroup1"
  }

Plan: 1 to add, 0 to change, 0 to destroy.

Do you want to perform these actions?
  Terraform will perform the actions described above.
  Only 'yes' will be accepted to approve.

Enter a value: yes
```

Destroying Infrastructure with Terraform

- **terraform destroy** allows us to destroy all the resources that are created within the folder.

Approach 1

- **#terraform destroy**

Approach 2

- **terraform destroy** with **-target** flag allows us to destroy specific resource.
- **#terraform destroy -target azurerm_resource_group.example1**

```
resource "azurerm_resource_group" "example1" {  
  name = "testgroup1"  
  location = "West US"  
}
```

```
resource "azurerm_resource_group" "example1" {  
  name = "testgroup1"  
  location = "West US"  
}
```

```
resource "azurerm_resource_group" "example2" {  
  name = "testgroup2"  
  location = "West US"  
}
```

| Resource Type/Global Resource Name | Local Resource Name |
|---------------------------------------|------------------------|
| azurerm_resource_group | example1 |
| azurerm_resource_group | example2 |

Terraform Destroy with Target

- The `–target` option can be used to focus Terraform attention on only a subset of resources.
- Combination of: Resource Type/Global Resource Name + Local Resource Name**
